

Admin Panel Testing Guide — Without Sharing Credentials

Project: Fixzone Bangladesh (fixzone.com.bd) **Document Version:** 1.0 **Date:** September 2026 **Audience:** Beginners in Software Testing

Important Note

You do NOT need to share your admin credentials with anyone to perform testing.

This guide shows you every testing method available — from tests you can run yourself,

to tests that only need a test/demo account, to fully automated approaches.

Table of Contents

1. Understanding Admin Panel Testing
2. Testing Types Overview
3. Type 1 — Black-Box Testing (No Login Needed)
4. Type 2 — Grey-Box Testing (Limited Access / Test Account)
5. Type 3 — Security Testing (Without Credentials)
6. Type 4 — Performance & Load Testing
7. Type 5 — API Testing (Without UI Login)
8. Type 6 — Accessibility Testing
9. Type 7 — Browser Compatibility Testing
10. Type 8 — Database & Backend Testing
11. Type 9 — Automated UI Testing (With Test Credentials)
12. The Safest Way to Give Testers Access
13. Bug Reporting Template
14. Tools Summary Table

1. Understanding Admin Panel Testing

An **admin panel** is a restricted area of a web application that allows authorized users (admins) to manage content, users, orders, settings, etc.

Why Testing It Is Tricky

- Admin credentials give **full control** over live data — sharing them is dangerous.
- A tester with full access can accidentally **delete real data** or **expose user information**.
- Many bugs are visible **from outside** the admin panel (e.g., effects of admin actions on the public website).

The Golden Rule

Never share your production admin password. Instead, use one of the safe alternatives described in this guide.

2. Testing Types Overview

#	Testing Type	Needs Admin Login?	Who Can Run It
1	Black-Box Testing	No	Anyone
2	Grey-Box Testing	Test account only	Tester with limited access
3	Security Testing	No (mostly)	Security tester / you
4	Performance Testing	No	Anyone with a URL
5	API Testing	Token-based (safe)	Developer / tester
6	Accessibility Testing	No	Anyone
7	Browser Compatibility	No	Anyone
8	Database / Backend	No (indirect)	Developer
9	Automated UI Testing	Test account only	Developer / tester

3. Type 1 — Black-Box Testing (No Login Needed)

What it is: Testing the admin panel's **public-facing effects** — what the admin does on the backend should reflect correctly on the public website.

You do NOT need to log in. You just check whether admin actions (made by you on your own machine) appear correctly on the website.

How to Do It — Step by Step

Step 1: Prepare Your Environment

1. Open two browser windows side-by-side:

- **Window A** — Your admin panel (logged in as YOU on your own computer)

- **Window B** — The public-facing Fixzone website (<https://fixzone.com.bd/>)

1. In Window A, make a change (e.g., add a new service, update a price, create a banner).
2. In Window B, refresh the public site and verify the change appeared correctly.

Step 2: Test These Admin Actions vs. Public Site

Admin Action	What to Verify on Public Site
Add a new service	Does the service appear in /services ?
Edit a service name/price	Does the new name/price show on the service card?
Disable/hide a service	Does it disappear from the public catalog?
Add a homepage banner	Does it render on the homepage hero section?
Change contact info	Does /contact page show updated details?
Create a new user account	Can that user log in on the public site?
Cancel/change order status	Does customer see updated status on their dashboard?
Add a blog post/announcement	Does it appear on the public news/blog section?

Step 3: Check Edge Cases

- Add a service with a **very long name** (100+ characters). Does it break the layout?
- Add a service with **special characters** in the name (e.g.,)
